

THACH HIEN - SOFTWARE ENGINEER

0906891704 | th.2806.dev@gmail.com | HCMCT | <https://thachhiendev.vercel.app>

SUMMARY

Passionate Full-Stack .NET Developer specializing in building high-performance web applications and structured web services. Highly skilled in .NET 10, ASP.NET Core, and ReactJS. Experienced in database modeling, decoupled multi-layered architecture, and AI-assisted development workflows to accelerate software delivery. Seeking an Intern Full-Stack position to contribute to scalable digital business solutions.

TECHNOLOGY STACK

Programming language	.NET C#, Modern JavaScript (ES6+), HTML5, CSS3
Frameworks & Libraries	ASP.NET Core Web API, Entity Framework Core, ReactJS (Vite), Bootstrap
Databases & Caching	SQL Server, MongoDB, Redis (Distributed Caching)
Other skills	JWT Authentication, Role-Based Access Control (RBAC), 3-Tier Layered Architecture, RESTful API Design
Infrastructure & Tools	Git, GitHub Workflow, Docker, Postman, Visual Studio, VS Code

PROJECTS

Movie Booking System | Full-Stack Developer (Monorepo)

Technologies: .NET 10, ASP.NET Core Web API, Entity Framework Core, SQL Server, ReactJS, Docker

GitHub Repository: <https://github.com/th2806-dev/movie-booking-system.git>

Description & Contributions

- Designed and structured a production-ready Movie Booking API using a 3-Tier Layered Architecture to achieve strict separation of concerns.
- Implemented secure authentication and authorization protocols utilizing JSON Web Tokens (JWT) and Role-Based Access Control (RBAC) to restrict unauthorized endpoints.

- Developed a dynamic theater seat reservation engine, successfully mapping incoming network Data Transfer Objects (DTOs) to secure Database Entities to prevent mass-assignment flaws.
- Built a custom Global Exception Handling Middleware to catch system-wide runtime errors, ensuring a zero-crash resilience API.
- Utilized LINQ to Entities to compose high-performance data aggregation queries, filtering top-grossing movie records directly inside SQL Server.
- Containerized the entire solution using Docker, managing service layers through isolated network configurations.

Enterprise Product Distribution & Logistics System | Core Backend Developer

Technologies: .NET 10, Web API, SQL Server, Redis, Hangfire, MongoDB, React, Advanced Design Patterns

GitHub Repository: <https://github.com/th2806-dev/enterprise-logistics-system.git>

Description & Contributions

- Engineered a high-performance distribution ecosystem designed to solve high-concurrency scenarios and big data bottlenecks.
- Integrated a Redis Distributed Caching layer for master data lookup, bypassing heavy DB trips and accelerating response times up to 50x.
- Applied database optimization strategies including strategic Clustered/Non-Clustered SQL Indexing, speeding up transaction queries across simulated high-volume records.
- Offloaded time-consuming operational tasks (automated inventory tracking, email billing notifications) to asynchronous background workers using Hangfire.
- Implemented a polyglot persistence architecture, using SQL Server for relational business integrity and MongoDB for rapid append-only system auditing logs.
- Leveraged advanced structural design principles, incorporating Strategy Pattern for dynamic multi-payment configurations and Factory Pattern for coupon generation.

EDUCATION

Ho Chi Minh City College of Transport

Information Technology (Software Application) | 2024 – 2027

GPA: 3.9/4
